

ABSTRACT

A system and method for transmitting data. The system includes a database that stores data. The data is sent to a server for processing. A relay is then used to route the data for transmission. A firewall provides security for the data, the server, and the relay.

- 5 The data is then sent by the relay to a wireless carrier network. A handheld wireless device receives the data from the wireless carrier network. In the system, the relay is arranged behind the firewall.
